1 Introduction and Description

1.1 Learning Benchmarking Tool

Business Monitor developed the Learning Benchmarking Tool (LBT) to evaluate and compare organisational learning programmes using the four Kirkpatrick levels: Reaction (L1), Learning (L2), Behaviour (L3), and Results (L4).[1]

The original LBT is a proof of concept based on fully synthetic programme- and participant-level data, structured for future use with real organisational data.[2] The MVP demonstrates KPI calculation, benchmarking, and exploratory predictive modelling without processing real participant data. Piloting with real organisational data is identified as a next step.[3]

This assessment considers an operational scenario in which Business Monitor administers participant surveys on behalf of participating organisations. This is an assumption: the original report envisages organisations submitting aggregated or pseudonymised data and does not specify that Business Monitor administers surveys.[4] It initially processes identifiable contact information to invite participants and manage surveys. After collection, participant-level survey and learning data are pseudonymised for analysis.

Business Monitor retains the identity-to-pseudonym mapping only as needed for the survey cycle, including Level 3 follow-up measurements. Identifying information and the mapping are stored separately from analytical data, with restricted access, safeguards assumed in this assessment.[5] They are deleted when re-identification is no longer necessary, according to the retention policy.[6]

Pseudonymised data are used to calculate programme-level KPIs across L1–L4. The original MVP includes an exploratory prediction model using synthetic data.[7] In the assessed operational scenario, predictive analytics remain limited to programme-level outcomes and KPIs, not individual employee performance, behaviour, or capabilities. This is an assumption: the original model only demonstrates exploratory scenario predictions, not validated predictions on real organisational data.[8]

Programme-level results support cross-organisational benchmarking, consistent with Business Monitor's proposed role as a neutral benchmarking hub.[9] Customer-facing outputs are intended to be aggregated and anonymised.

2 How Are the Data Processed?

2.1 Purpose of the processing

The LBT involves five processing operations: survey administration, participant-level analysis, programme-level KPI calculation (L1–L4), programme-level predictive analytics, and cross-organisational benchmarking.[10] The first four support each organisation's programme evaluation, with Business Monitor acting on its behalf. Benchmarking additionally serves Business Monitor's own service across organisations.

2.2 Application of the data protection principles

2.2.1 Lawfulness, fairness and transparency

Lawfulness is examined in Section 3. Fairness and transparency require participants to understand how their responses are used, particularly for commercial benchmarking.[11] Where contact details come from employers, Article 14 requires information no later than the first communication, subject to applicable exceptions; survey responses collected directly fall under Article 13.[12] Notices must identify the relevant controllers and purposes in clear language, including any further processing.[13]

[13] (GDPR 2016, arts. 12(1), 13(1)(a) and (c), 13(3), 14(1)(a) and (c))

2.2.2 Purpose limitation

Article 5(1)(b) requires specified, legitimate purposes and restricts incompatible further processing.[14] Benchmarking introduces a distinct commercial purpose beyond an employer's programme evaluation. Under Article 6(4), compatibility depends on the relationship between purposes, collection context, participants' reasonable expectations, data sensitivity, consequences and safeguards.[15]

Statistical processing receives special treatment under Articles 5(1)(b) and 89(1), while Recital 162 describes aggregate statistical results not used for individual decisions.[16] However, statistical safeguards do not automatically authorise commercial reuse. Benchmarking therefore requires a documented assessment of purpose compatibility and an appropriate legal basis.

2.2.3 Data minimisation

Article 5(1)(c) restricts collection to necessary data.[17] Direct identifiers serve survey administration, while analysis uses pseudonymised responses. The original dataset includes location, manager-support ratings and promotion flags.[18] Their necessity must be justified individually; programme-level promotion counts may reduce the need to retain individual flags. Free-text responses should be avoided where unnecessary.

2.2.4 Accuracy

Article 5(1)(d) requires accuracy and appropriate updating.[19] The LBT relies partly on self-reported measures, which the original report identifies as vulnerable to response bias.[20] Follow-up records must also remain correctly linked to their pseudonymous identifiers.

2.2.5 Storage limitation

Article 5(1)(e) limits retention to what is necessary.[21] Identification data and re-identification mappings are deleted after required follow-ups. Analytical data remain personal data wherever re-identification is reasonably possible, even after deleting the mapping.[22] Small cohorts and contextual variables increase this risk. The MVP's eight-participant threshold is a data-quality criterion, not proof of anonymity.[23]

2.2.6 Integrity and confidentiality

Articles 5(1)(f) and 32 require appropriate security.[24] Identifiers and re-identification mappings must remain separate from analytical data, with access restricted to authorised survey personnel.

2.2.7 Accountability

Article 5(2) requires controllers to demonstrate compliance.[25] Participating organisations remain accountable for their evaluation purposes; Business Monitor must demonstrate compliance where it independently determines benchmarking purposes. Section 4 addresses the necessary agreements and records.

3 On Which Legal Basis?

3.1 The processing ground relied on

The operational LBT involves two purposes requiring separate legal assessments, and the roles follow from who determines the purposes and means of each.[26] A controller determines why and how personal data are processed; a processor acts only on the controller's instructions. The participating organisation decides to evaluate its own

[14] (GDPR 2016, art. 5(1)(b))

[25] (GDPR 2016, art. 5(2))
[26] (GDPR 2016, arts. 4(7), 4(8), 26(1), 28(3) and 28(10))

programmes, so it is controller for that purpose, with Business Monitor as its processor administering surveys and analysing results on its instructions. Benchmarking serves Business Monitor's own commercial service. A processor that determines purposes and means is considered a controller for that processing, so Business Monitor acts as controller for benchmarking where it designs the service and decides how the data are combined. If the participating organisation co-determines these purposes and means, both are joint controllers and must allocate responsibilities between them. If it merely supplies data to a service that Business Monitor designs, they are separate controllers, and the organisation's disclosure of data for that purpose needs its own legal basis.

For both purposes, legitimate interests under Article 6(1)(f) GDPR is the proposed legal basis. It requires a legitimate interest, necessity of processing, and a balancing assessment demonstrating that participants' interests and fundamental rights do not override that interest.[27] Recital 47 specifically requires consideration of participants' reasonable expectations. Consequently, legitimate interests cannot be presumed valid merely because the processing benefits the organisation.

3.2 Application of its criteria

3.2.1 Organisational evaluation

Legitimate interest. Participating organisations have a legitimate interest in assessing learning effectiveness and improving training investments. Measuring satisfaction, knowledge acquisition, behavioural application and organisational outcomes supports this objective.

Necessity. Contact details enable survey invitations and follow-ups. Pseudonymised responses enable longitudinal analysis and programme-level KPI calculation. However, necessity must be established for each data category. Anonymous surveys or aggregated measurements may achieve some evaluation objectives with less interference, although they may not support participant-linked follow-ups. The organisation must therefore demonstrate why its chosen data are required rather than merely useful.[28]

Balancing. Employees may reasonably expect evaluation of training they attended, supporting the employer's interest. Nevertheless, the employment relationship creates a power imbalance. Responses concerning behaviour, managerial support or promotion could also affect employees if accessed or interpreted individually. Pseudonymisation, restricted access, limited retention and programme-level reporting reduce these risks but do not eliminate them.

On these assumptions, legitimate interests may support organisational evaluation, provided participation requirements, data necessity and safeguards are assessed and documented. Individual employee assessment or employment decisions would require a separate assessment.

3.2.2 Business Monitor's benchmarking service

Legitimate interest. Business Monitor has a commercial interest in producing comparable learning-effectiveness benchmarks across participating organisations. A commercial interest can qualify under Article 6(1)(f), but does not automatically outweigh participants' rights.[29]

Necessity. Cross-organisational comparison requires sufficiently consistent programme-level indicators. It does not necessarily require identifiable or pseudonymised participant records to be retained centrally. Business Monitor must assess whether participating organisations could instead supply anonymous programme-level aggregates. If these are sufficient, continued processing of personal data for benchmarking would be difficult to justify as necessary.

Balancing. Benchmarking creates a greater privacy concern than internal evaluation. Employees may expect their employer to assess training effectiveness, but not necessarily anticipate their responses contributing to another company's commercial service. Small cohorts, contextual variables and organisational knowledge increase re-identification risks. Aggregation and pseudonymisation mitigate these risks, provided anonymity is assessed rather than assumed.

Business Monitor should disclose the benchmarking purpose before processing, document the legitimate interests assessment, and ensure that benchmark outputs cannot reasonably identify participants. The Article 6(4) compatibility assessment discussed in Section 2 remains relevant where data are reused for a different purpose.[30]

On the present facts, legitimate interests for benchmarking is less securely established than for organisational evaluation. It remains conditional on demonstrating that personal data are necessary and that participants' rights do not prevail.

[27] (GDPR 2016, art. 6(1)(f) and recital 47)
[28] (GDPR 2016, art. 5(1)(c) and art. 6(1)(f))
[29] (GDPR 2016, art. 6(1)(f) and recital 47)
[30] (GDPR 2016, art. 6(4) and recital 26)

3.3 Problems with relying on this ground

The principal difficulty is demonstrating necessity and a favourable balancing outcome for both purposes, especially commercial benchmarking. Controllers must document their assessments rather than assume that pseudonymisation or transparency alone establishes lawfulness. Participants also have a right to object to processing based on Article 6(1)(f), subject to the conditions in Article 21.[31]

Other Article 6 grounds are less suitable on the stated facts. No specific legal obligation, vital interest or public task has been identified. Article 6(1)(b) concerns necessity for a contract with the data subject; the commercial agreement between Business Monitor and an employer does not itself establish this ground for employee data. Consent is theoretically possible but problematic in employment because it may not be freely given.[32]

The scenario does not intend to collect special-category data. Nevertheless, free-text responses could reveal health information or other categories protected by Article 9(1). In such cases, an Article 6 basis and a valid Article 9(2) exception would both be needed.[33] Explicit consent is one possible exception, but its validity is particularly difficult to establish in employment. Other exceptions depend on specific conditions and cannot be assumed applicable here. Avoiding unnecessary free-text fields and excluding special-category information is therefore preferable.

Overall, Article 6(1)(f) is a plausible basis for organisational evaluation, subject to a documented assessment. For Business Monitor's benchmarking service, the justification remains uncertain unless the necessity of personal-data processing, compatibility of purposes and effective safeguards can be demonstrated. Anonymous programme-level inputs offer a less intrusive alternative.

4 Advice

4.1 Alternatives to personal data

Business Monitor should minimise personal data processing by using anonymous programme-level data wherever feasible. Participant-level information may be necessary for survey administration, longitudinal follow-ups and calculating certain learning indicators, but directly identifiable records are not required for programme-level predictions or customer-facing benchmarks.[34] Business Monitor should assess whether participating organisations can calculate and submit anonymous programme-level indicators instead of transferring participant records.

Where participant-level processing remains necessary, survey responses should be pseudonymised as early as practicable. Identity data and re-identification mappings must be stored separately from analytical records, with access restricted to authorised personnel.[35] The mapping should be deleted once the survey cycle, including necessary follow-ups, is complete and re-identification is no longer required.[36] However, deletion does not automatically anonymise the remaining records: contextual information may still permit identification.

Unnecessary demographic attributes and unrestricted free-text responses should be avoided. Before releasing benchmark results, Business Monitor must assess whether participants could be identified through small cohorts, rare characteristics or combinations of variables. Aggregation alone does not guarantee anonymity.[37] Where genuinely anonymous inputs can achieve the benchmarking purpose, they offer a less intrusive alternative to processing personal data.

For benchmarking, Business Monitor could therefore act as the participating organisation's processor and compute anonymous programme-level aggregates on its instructions, so that only those aggregates enter the benchmark pool. Anonymous data fall outside the GDPR,[38] and the benchmark itself would then need no separate legal basis. The anonymisation step is itself processing of personal data and must be covered by the organisation's legal basis and instructions,[39] and the anonymity of its output must be tested as described above.

4.2 Technical and organisational measures

The operational LBT requires safeguards addressing transparency, retention, security, re-identification and accountability.

First, participating organisations and Business Monitor should clearly distinguish organisational evaluation from cross-organisational benchmarking in their privacy notices. Participants must understand the relevant purposes,

[31] (GDPR 2016, art. 21(1))
[32] (GDPR 2016, arts. 6(1)(a), 6(1)(b) and 7(4), recital 43)
[33] (GDPR 2016, arts. 6(1) and 9(1)-(2))
[34] (GDPR 2016, art. 5(1)(c))
[35] (GDPR 2016, art. 4(5))
[36] (GDPR 2016, art. 5(1)(e))
[37] (GDPR 2016, recital 26)
[38] (GDPR 2016, recital 26)
[39] (GDPR 2016, arts. 4(2) and 28(3))

controller identities, data categories and intended uses before the applicable processing begins. The commercial benchmarking purpose should not be concealed within a general description of employee training evaluation.[40]

Second, a documented retention schedule should define separate periods for identification data, re-identification mappings, pseudonymised analytical records and programme-level outputs. Identifiers and mappings should be deleted when the final necessary follow-up is complete, with deletion recorded. Analytical records require independently justified retention periods and periodic review. Anonymous outputs may be retained outside the GDPR only where anonymity has been adequately established.

Third, Business Monitor should implement encryption, role-based access controls and access logging. Identifying information and re-identification mappings must remain separate from analytical datasets. Re-identification access should be restricted to personnel administering surveys, while analysts should receive only the data necessary for their tasks.[41]

Fourth, benchmark disclosure controls should include minimum cohort sizes, suppression of small groups and checks for identifying combinations of attributes. The original LBT uses eight participants as a minimum benchmark-readiness criterion, but this was designed for data quality rather than anonymity.[42] The threshold must therefore be evaluated against actual re-identification risks, including risks in programme-level predictive outputs.

Finally, accountability arrangements must be established before operational deployment. These include documented controller–processor responsibilities, Article 28 agreements for processing on behalf of participating organisations, records of processing activities and data protection by design and by default.[43] Business Monitor and participating organisations should also assess whether a Data Protection Impact Assessment is required, considering the nature, scale and risks of employee-data processing.[44] A DPIA is mandatory where processing is likely to result in a high risk to individuals.

4.3 Conclusion on compliance

The current LBT proof of concept uses synthetic data and does not demonstrate GDPR compliance for an operational service involving real participants. Such deployment would require a documented legal and organisational framework before personal data are processed. On the present facts, the operational LBT cannot yet be regarded as GDPR compliant. Organisational evaluation can be made compliant through a documented legitimate interests assessment, transparency and the safeguards in Section 4. Cross-organisational benchmarking remains doubtful unless necessity and a favourable balance are shown; otherwise it should rely on anonymous programme-level inputs.

Two purposes must be assessed separately, with different roles (Section 3.1). Participating organisations are controllers for their own programme evaluations, with Business Monitor as processor. For cross-organisational benchmarking Business Monitor acts as controller, possibly jointly with the participating organisations.[45] These responsibilities must be documented for each processing activity.

Legitimate interests under Article 6(1)(f) is the proposed legal basis, but its suitability remains conditional.[46] Organisational evaluation may be justified where processing is necessary and proportionate. Commercial benchmarking presents a greater challenge because participants may not reasonably expect their responses to support a service across organisations. A separate, documented assessment must establish necessity, purpose compatibility and a favourable balancing outcome. Transparency and safeguards cannot independently establish lawfulness.

Special-category data should not be collected unless an applicable Article 9 exception and a valid Article 6 basis have been established.[47] Survey design should minimise inadvertent collection.

The recommended approach is conditional deployment. Real participant data should be processed only after responsibilities, lawful bases, retention rules, access controls and disclosure safeguards have been established. If these conditions cannot be met, Business Monitor should restrict the affected activities to genuinely anonymous programme-level data or postpone deployment.

Technology Statement
